

Abstract

A medical syringe comprising a cylindrical connection supporting member increasing the holding force of a lure inserted
5 into a connection target. The connection supporting member is formed to be slid along the lure or a syringe body part in a state of being movable between a first position near a tip of the lure and a second position away from a tip of the lure. The syringe is characterized in that, when the connection supporting member is moved to the second
10 position, the tip of the lure is exposed.
